

Micro water jet debridement

Impact pressure

The impact pressure is the abrasive effect brought about by the water jet of the debritor⁺. It is the force per area which pushes (arrives) on the wound surface. The impact pressure's force is dependent on the intensity level selected at the debritor⁺ and the distance and angle of the handpiece in relation to the wound surface. The impact pressure ranges between 1 to 13 psi with the recommended distances and angles to the wound.
