medaxis microjet therapy

for an optimal wound bed preparation and accelerated healing!

The clinical results of the medaxis microjet wound therapy show a significantly faster wound healing, a reduced infection rate and less adverse events. ⁽¹⁾

Percentage of wound area reduction

2× FASTER HEALING*

Percentage of wounds having at least 1 infection during treatment

6× LESS WOUND INFECTIONS*

+ microbleeding and neovascularization

The energy of the microfluid jet provokes microbleeding, which feeds the wound with the oxygen and nutrients needed for neovascularization and tissue growth.

+ stimulation and oxygenation

The stimulation of the wound bed with the microfluid jet increases cellular activity and circulation, which allows the oxygen provided during the treatment to be delivered to the wound.

+ biofilm removal and bacterial load reduction

The biofilm is a major barrier to wound healing. Its removal by the microfluid jet leads to bacterial load reduction which is important for the healing process.
